SQL Tabs Cracked Version is a no-nonsense and fairly capable SQL client that offers you a simple environment to execute queries, run scripts and explore database objects. Straightaway, you should know that this simplistic utility is capable of working with PostgreSQL, MySQL, MS SQL, MariaDB, and Amazon Redshift databases. It's also worth pointing out that it can be run just as easily on all major OSes out there, namely Windows, macOS, and Linux. Can be launched with the minimum of effort on your part Getting started with SQL Tabs is hardly challenging since the utility can be launched without the need of installation. Please take into account that this is not the most user-friendly SQL client out there, as it is mainly intended for users that already know a thing or two about databases. The app sports a tabbed user interface with a strong focus on simplicity. Connecting to a database requires you to enter the username, host, port number, database name, and password, if necessary, in the following format: "protocol://user@host:port/dbname". Packs all the basic features you would expect from an SQL client That said, you can access the app's main features from the Database menu, located up top. You can explore the object within your database, run scripts, execute blocks, break executions, and even get a complete history of all the executed queries. It's also worth mentioning that SQL Tabs makes it possible for you to create comprehensive charts based on your query results. Markdown rendering support, rich scripts output, two editing modes (Classic and Vim), two UI themes, as well as the possibility to export your work to JSON and CSV are some extra features that might arouse your interest in this app. Pragmatic and simplistic, cross-platform SQL client All in all, if you're not learning the ropes of database languages and you're looking for a minimalist yet capable SQL client, the SQL Tabs should be definitely on your list of possible options.

> Streamline your work and get a clear overview of all the queries performed. > Easily make big datasets more manageable with a simple chart of all the queries executed. > Run a series of scripts to inspect your tables, databases, user access permissions, and more. > Run a comprehensive table of queries executed in the past, allowing you to quickly get an overview of your database activity. > Run a few queries and then break them for further editing. > Export your work in CSV and JSON to create beautiful tables and charts, or keep them handy for future projects. > Use the notepad mode to analyze your scripts step by step. >... more ParallelExplorer by Loxware is a highly customizable Network Inventory app that makes it super easy to monitor your network. Identify what's taking up bandwidth, determine where your bottleneck lies and why, then find the perfect balance between acceptable performance and absolute performance. This can be tricky without a tool like ParallelExplorer. We've all had the frustrating experience of searching for hours only to find that there was nothing on our network. This is a painful process and a sign of a serious bottleneck somewhere. And if you're lucky, you may even be able to find a culprit! ParallelExplorer is an easy to use and incredibly powerful Network Inventory and Diagnostic tool. It will allow you to see what is consuming the bandwidth on your network and find out if your network is bogged down in any way. When dealing with a bottleneck, we need to find a balance. We can either accept the performance, or we can accept zero performance. In this case, ParallelExplorer gives us the power to take a middle ground. Get started with ParallelExplorer! Parallelexplorer allows you to see what is using your bandwidth on your network. It's very easy to install. Just install Parallelexplorer to the network you would like to view. When you open the app, it will display the results in a dashboard. Clicking on a device in the dashboard will display the device statistics. You can filter the devices displayed by OS and/or by IP. To the right of the dashboard is a map. You can select any device and it will be placed on the map and you can see what IP it is connected to. To the left of the dashboard are graphs. You can select a graph and it will be graphed

What's New In SQL Tabs?

Using SQL Tabs is a very straightforward process that might take you a little time to get used to. The app doesn't boast of many features, but it packs a good amount of substance, making it possible for you to explore, run and execute queries on all major databases, as well as create some interesting charts out of your queries' results. SQLTabs is a small, scriptable, and cross-platform GUI for MySQL and MS SQL databases. The tool provides tabbed windows where you can switch between tables, views and stored procedures, run queries, auto-generate stored procedures, and also create visualisations. The app is simple to install and use but may lack in advanced features, so users with a greater knowledge of databases should find it challenging to use it. Version 1.18.0 and higher support Markdown for query and DDL output. Also, it is now possible to add data to tables and implement a customised query limit. Users of SQL Server, other SQL databases, and even the JSON/CSV exporters can benefit from these additions. Added option to set SQL editor max line length SQLTabs has now gained the ability to set the SQL editor max line length. It can be found in the Settings under the Text Editor section. This option allows you to set the editable line length for lines containing SQL statements. To apply the maximum edit length, set it to the value you would like to see in the editor. To check how the new setting will affect your SQL editor, make sure to open the SQL files the app creates when it executes stored procedures. Added support for tables pre-created in CREATE TABLE statements SQLTabs can now create tables if the table already exists in the target database. Simply open the File menu and select Create Table. This new option can be used for users who want to use SQLTabs to automate the process of creating tables. When using the Create Table option, SQLTabs will: Check if the table exists; If it doesn't exist, it will create the table; If the table already exists, the app will silently skip it. Added the ability to draw borders around tables in queries You can use the new Table property to draw borders around tables in queries. These borders can be enabled/disabled via the Context menu in the Table: Click the border to select it, and then use the Draw Selected button to toggle it on or off
